

# PHYSICIAN ACCESS INDEX ${ }^{\circ}$ 

A State-by-State Compilation of Benchmarks and Metrics Influencing Patient Access to Physicians and Advanced Practitioners

## MERRITT $\underset{\text { an AMN Heatthcare company }}{\text { HAWK }}$

A Resource Provided by Merritt Hawkins, the Nation's Leading Physician Search and Consulting Firm and A Company of AMN Healthcare (NYSE: AHS), the Largest Healthcare Workforce Solutions Organization in the United States

## ABOUT MERRITT HAWKINS

Established in 1987, Merritt Hawkins is the leading physician search and consulting firm in the United States and is a company of AMN Healthcare (NYSE: AHS), the largest healthcare workforce solutions organization in the nation. Merritt Hawkins produces a series of surveys, white papers, books, and speaking presentations internally and also produces research and thought leadership for third parties. Organizations for which Merritt Hawkins has completed research and analysis projects include The Physicians Foundation: The Indian Health Service: Trinity University: The American Academy of Physician Assistants: The

## Association of Academic Surgical Administration: and The North Texas Regional Extension Center.

This is one in a series of Merritt Hawkins' surveys, white papers, and reports examining a variety of topics directly or indirectly affecting the recruitment and retention of physicians and advanced practice professionals, including physician assistants (PAs) and nurse practitioners (NPs).

See pages 21 and 22 for a list of additional Merritt Hawkins whitepapers, surveys, books, and speaking presentations.

## INTRODUCTION: ACCESS--THE NEW MANTRA IN HEALTHCARE

Healthcare delivery in the United States is following a pattern present in the wider culture in which consumers demand (and generally receive) increasingly rapid access to information, goods and services of all types.

In healthcare, this pattern can be seen in the rapid proliferation of sites of service -- or technology based resources -- that offer patients greater convenience when accessing physicians or other clinicians, such as nurse practitioners (NPs) and physician assistants (PAs).

The "convenient care movement" is most visible in the growing number of urgent care centers, retail clinics, community health centers, free standing emergency departments, ambulatory surgery centers, telehealth services, and online physician appointment services that are being established nationwide. Convenience and accessibility are seen as the keys to capturing market share as larger, integrated healthcare systems, investors and other entities seek to be "everywhere, all the time." More information about this trend
is available in the Merritt Hawkins' white paper, Convenient Care: The Growth and Staffing of Urgent Care Centers and Retail Clinics.

In this document, Merritt Hawkins examines on a state-by-state basis the demographic, economic, health insurance coverage, physician, NP, and PA workforce factors that influence and at times determine patient access to medical services.

Merritt Hawkins' Physician Access Index (PAI) includes 33 of these benchmarks and metrics that contribute to the relative ease or difficulty patients may have in accessing the services of physicians and other healthcare professionals. Merritt Hawkins PAI is provided as a resource to healthcare facility administrators, physicians, policy makers, academics, media members and others who track trends in physician, NP, and PA supply, demand and accessibility.

States are ranked from 1-50 based on the presence or absence of factors tending to promote patient access to physicians or to inhibit such access.

## WHO WILL OBTAIN ACCESS?

The services provided by physicians, NPs, PAs and the facilities in which they work are like many other goods and services available to consumers: there is a finite supply but a virtually unlimited demand.

Access to healthcare and other services is largely determined by the consumer's ability to pay, though other factors come into play, including the number and distribution of healthcare professionals in a given area, their practice plans and patterns, patient and provider demographics, and available social resources.

Access to physicians has become a particular concern among healthcare professionals, policy makers, and patients as the supply of newly trained physicians remains flat, while demand generated by population aging, population growth and other factors accelerates. As a result of these trends, the Association of American Medical Colleges projects a deficit of up to 90,400 physicians nationwide by 2025 (see following chart).

## PHYSICIAN DEFICITS THROUGH 2025

Source: Association of American Medical Colleges

The factors driving the physician shortage, and additional shortage metrics and statistics by state, are included in the Merritt Hawkins' white papers, The Physician Shortage: Data Points and

[^0]
## MERRITT HAWKINS PHYSICIAN ACCESS INDEX®

Listed below are 33 benchmarks and metrics that influence patient access to physicians, PAs, and NPs, by state. The charts on pages 4, 5 and 6 indicate the numerical data per each of the 33 benchmark categories. For example, Alabama has 180.8 physicians per 100,000 population, as seen in category 1 on page 4, Alaska has 223.8 physicians per 100,000 population, Arizona 206.6 per 100,000 population, etc. The charts on pages 7, 8, and 9 indicate where each state ranks per category. As seen in category 1 on page 7, Alabama, with 180.8 physicians per 100,000 population, ranks 44th out of 50 states in
physicians per capita, Akaska, with 223.8 physicians per 100,000 population, ranks 22nd, Arizona, with 206.6 physicians per population, ranks 31st, etc. A low score indicates a relatively positive effect on patient access. For example, Massachusetts has the highest ratio of physicians per population of any state, and therefore is given a numerical score of 1 in this category. Mississippi has the lowest ratio of physicians per population and therefore is given a 50. States with the lowest cumulative scores have the most favorable physician access metrics and those with the highest have the least favorable.

## PHYSICIAN ACCESS INDEX: CUMULATIVE SCORES BY STATE

The chart below ranks the 50 states, from those with the lowest PAI scores, and hence the most positive physician access metrics, to those with the
highest PAI scores, and hence the least positive physician access metrics (NP and PA access metrics also are included).

PHYSICIAN ACCESS INDEX BY STATE: CUMULATIVE SCORES FROM 1 TO 50

|  | State | Cumulative Score |
| :---: | :---: | :---: |
| 1 | Massachusetts | 442 |
| 2 | New Hampshire | 491 |

| 49 | Nevada | 1077 |
| 50 | Oklahoma | 1096 |

## PHYSICIAN ACCESS INDEX MAP

ACCESS BY STATE

As the chart indicates, Massachusetts has the most positive physician access metrics of the 50 states, while Oklahoma has the fewest. Large states with disparate populations such as California, Florida and Texas tend to have fewer positive metrics while smaller states tend to have the most.

The three tiers of patient access were determined by finding the difference in the cumulative score of the first ranked state (Massachusetts

## ACCESS BY STATE

50
LOWEST

HIGHEST

- 442) and the last ranked state (Oklahoma 1096). Next, the difference of 654 was divided by 3 to establish the tier index indicator. The end of the first tier was set at 660, the sum of Massachusetts score (442) and the tier index indicator (218). The second tier cutoff point was set at 878 , the sum of the first tier cutoff point (660) and the tier index indicator (218).

## BENCHMARKS AND METRICS

Below is a brief description of each of the 33 benchmarks and metrics cited above and their potential effect on patient access to medical services.

## 1. PHYSICIANS PER 100,000 POPULATION

Source: Association of American Medical Colleges 2013 State Physician Workforce Data Book.
An indicator of per capita physician supply, this metric shows pronounced disparities between states. Massachusetts, for example, has 324 physicians per 100,000 population while Texas has only 183. However, it cannot be concluded from these numbers that access to medical professionals is uniformly poor in Texas and uniformly good in Massachusetts. In its 2014 Survey of Physician Appointment Wait Times, Merritt Hawkins found that Boston has the highest average wait times to see a physician while Dallas has the lowest among 15 large metropolitan areas. Other factors cited in Merritt Hawkins' PAI also can affect access and create disparities within a state. Nevertheless, a high ratio of physicians per capita tends to promote access. Massachusetts, which has the highest ratio of physicians per capita, therefore is ranked 1st in this metric by Merritt Hawkins' PAI, while Mississippi, which has the lowest ratio, is ranked 50th.

## 2. PRIMARY CARE PHYSICIANS PER 100,000 POPULATION

Source: Association of American Medical Colleges 2013 State Physician Workforce Data Book.
Primary care physicians, such as family physicians and general internists, are the key to emerging delivery models that promote access, quality, and cost effectiveness, as they act as care coordinators who provide preventive services, chronic care services, and help ensure patients have appropriate access to medical specialists. A high number of primary care physicians per capita therefore is likely to increase access to specialty services and other medical services. Massachusetts has the highest number of primary care physicians per capita and is ranked 1st by Merritt Hawkins' PAI while Mississippi has the lowest and is ranked 50th.

## 3. MEDICAL RESIDENTS PER 100,000 POPULATION

Source: Association of American Medical Colleges 2013 State Physician Workforce Data Book.
This metric indicates the number of physicians per capita being trained within a state and reflects the state's ability to "grow its own" physician workforce. Historically, the Northeast has been the center of physician training in the United States, with Massachusetts and New York ranked one and two for most physicians trained. Large states in the West, such Texas and California, have not added medical residents commensurate with population growth, nor has Florida in the Southeast. Low population Western states such as Montana and Wyoming may not have the resources or population to maintain large teaching facilities and must recruit virtually all of their physicians from out of state. Massachusetts has the most medical residents per capita and is ranked 1st by Merritt Hawkins' PAI, while Montana has the fewest and is ranked 50th.

## 4. PERCENTAGE OF RESIDENTS RETAINED

Source: Association of American Medical Colleges 2013 State Physician Workforce Data Book.
This metric indicates the net number of medical residents being added to the physician workforce of each state. Some states are more successful in holding onto the physicians they train than are others. California, for example, is in the middle of the pack in number of physicians trained per capita but is number one in percent of residents retained. By contrast, Massachusetts and New York are in the middle of the pack in number of medical residents retained though they are first and second respectively in residents trained per capita. Retention rates can be affected by relative competition in each state, reimbursement rates, cost of practice/cost of living, state funding for physician retention and related matters.

## 5. HEALTH PROFESSIONAL SHORTAGE AREAS/PRIMARY CARE PER CAPITA

Source: Health Resources and Services Administration (HRSA).
Health Professional Shortage Areas (HPSAs) for primary care, as tracked by the federal government, are areas in which the ratio of primary care physicians falls below one per 3,500 population. There now are over 6,080 primary care HPSAs in the United States, double the number tracked approximately 15 years ago. As is to be expected, larger states such as California have the most, while smaller states have fewer. Merritt Hawkins' PAI therefore ranks number of primary care HPSAs per capita, providing an indication of which states have the largest percent of population in underserved areas and which the fewest. New Jersey has the fewest primary care HPSAs per capita and therefore is ranked 1st in this metric, while Alaska has the most per capita and is ranked 50th.

## 6. PRACTITIONERS NEEDED TO REMOVE PRIMARY CARE HPSA DESIGNATIONS PER CAPITA

Source: Health Resources and Services Administration/Merritt Hawkins.
HRSA indicates the number of primary care physicians needed per state to remove the state's HPSA designations. Texas, for example, has 375 primary care HPSA designations and requires 514 primary care physicians to remove these designations, according to HRSA. Merritt Hawkins' PAI ranks each state by the number of primary care physicians needed to remove these designations per capita, providing a further indication of the percent of population by state with limited access to physicians. New Jersey requires the fewest physicians per capita to remove its designations and is ranked 1st in Merritt Hawkins' PAI, while New Mexico requires the most and is ranked 50th.

## 7. PERCENTAGE OF PRIMARY CARE NEED MET

Source: Health Resources and Services Administration.
This metric shows which states have met the most primary care needs of their populations and which have met the least. Delaware is ranked 1st in Merritt Hawkins' PAI and has met the most needs while Connecticut is ranked 50th and has met the fewest needs.

## 8. HEALTH PROFESSIONAL SHORTAGE AREAS/MENTAL HEALTH PER CAPITA

Source: Health Resources and Services Administration.
Health Professional Shortage Areas for mental health as tracked by HRSA are areas in which the ratio of psychiatrists falls below one per 30,000 population. There are now approximately 4,900 mental health HPSAs nationwide. This metric ranks states by fewest mental HPSAs per capita to most per capita, providing an indication of which states have the greatest percent of population living in mental health shortage areas. As with primary care HPSAs, New Jersey has the fewest mental health HPSAs per capita and is ranked 1st, while Alaska has the most and is ranked 50th.

## 9. PRACTITIONERS NEEDED TO REMOVE MENTAL HEALTH HPSA DESIGNATIONS PER CAPITA

Source: Health Resources and Services Administration/Merritt Hawkins.
HRSA indicates the number of psychiatrists needed per state to remove the state's mental health HPSA designations. Merritt Hawkins' PAI ranks each state by the number of psychiatrists needed to remove these designations per capita. Rhode Island requires the fewest psychiatrists per capita to remove its designations and is ranked 1st in Merritt Hawkins' PAI, while Wisconsin requires the most and is ranked 49th (no data is available for Vermont for this metric, therefore 49 represents the lowest ranking).

## 10. PERCENTAGE MENTAL HEALTH NEED MET

Source: Health Resources and Services Administration.
This metric indicates which states have met the most mental health care needs and which have met the least. Rhode Island is ranked first in Merritt Hawkins' PAI and has met the most needs while South Dakota is ranked 49th and has met the fewest needs (no data is available on Vermont for this metric, therefore 49 represents the last ranking).

## 11. PERCENTAGE OF ADULTS 18-64 WITH HEALTH INSURANCE

Source: The Commonwealth Fund, Health System Data Center, http://datacenter.commonwealthfund.org/\#ind=526/sc=38 Access to health care services can be significantly influenced by a given population's ability to pay for such services. Merritt Hawkins' PAI ranks states by percent of adults below the age of Medicare eligibility who have health insurance. Massachusetts has the highest rate of insured adults and is ranked 1st while Texas has the lowest rate and is ranked 50th.

## 12. \% OF CHILDREN 0-17 WITH HEALTH INSURANCE

Source: The Commonwealth Fund, Health System Data Center, http://datacenter.commonwealthfund.org/\#ind=526/sc=38 . Massachusetts has the highest percent of children with health insurance and is ranked 1st by Merritt Hawkins' PAI while Nevada has the lowest percent and is ranked 50th.

## 13. PERCENTAGE OF POPULATION WITHOUT HEALTH INSURANCE

Source: United States Census Bureau.
Of the total population, including the Medicare eligible, Massachusetts has the highest rate of insured and is ranked 1st in Merritt Hawkins' PAI while Texas has the fewest and is ranked 50th.

## 14. PERCENTAGE OF ADULTS WITH A USUAL SOURCE OF CARE

Source: The Commonwealth Fund, Health System Data Center, http://datacenter.commonwealthfund.org/\#ind=526/sc=38 . While health insurance coverage can be an important avenue to care, not all those who are insured (and many of the uninsured) do not have a regular care provider. New Hampshire and Massachusetts have the highest rate of residents with a usual source of care and are ranked 1st in Merritt Hawkins' PAI while Alaska has the lowest rate and is ranked 50th.

## 15. POVERTY RATE

Source: United States Census Bureau.
The poverty rate in a given state or location may limit the ability of the population to access goods and services, including physician and other medical services. However, poverty also drives utilization of health services (see Poverty, Wealth, and Healthcare Utilization, Richard Cooper, MD, et al, Journal of Urban Health: Bulletin of the New York Academy of Medicine, Vol 89, No 5, Nov 2015.), which also may limit patient access by raising demand. Whether it reduces access or increases utilization, poverty rate is a negative access metric. New Hampshire has the lowest poverty rate and is ranked 1st by Merritt Hawkins' PAI while Mississippi has the highest poverty rate and is ranked 50th.

## 16. MEDIAN HOUSEHOLD INCOME

Source: United States Census Bureau.
Populations with relatively high incomes typically have greater access to goods and services than those in lower income areas, including physician and other medical services, though need and utilization for such services generally is lower among the affluent than the poor. Whether it increases access or reduces utilization, high median household income is a positive access metric. New Hampshire has the highest median household income and is ranked 1st by Merritt Hawkins' PAI while Louisiana has the lowest and is ranked 50th.

## 17. PERCENT OF ADULTS REPORTING NOT SEEING A DOCTOR IN THE PAST 12 MONTHS BECAUSE OF COST

Source: The Henry J. Kaiser Family Foundation, 2013.
Both the insured and the uninsured may find lack of finances to be an impediment to care, in the case of the insured if deductibles or co-pays are prohibitive. North Dakota has the fewest percent of residents who did not see a physician in the last 12 months for financial reasons and is ranked 1st in Merritt Hawkins' PAI, while Mississippi has the most and is ranked 50th.

## 18. MEDICARE BENEFICIARIES AS A PERCENT OF TOTAL POPULATION

Source: The Henry J. Kaiser Family Foundation, 2012.
The availability of health insurance coverage, including government sponsored Medicare for those eligible, generally has the effect of increasing access to physicians and other medical services. West Virginia has the highest rate of Medicare coverage per capita at $21.1 \%$ and is ranked 1st by Merritt Hawkins PAI, while Alaska has the lowest rate of Medicare coverage per population and is ranked 50th.

## 19. PHYSICIAN MEDICARE ACCEPTANCE RATES

Source: The Physicians Foundation/Merritt Hawkins 2014 Survey of America's Physicians. Healthcare coverage, including government funded programs such as Medicare and Medicaid, while generally a positive access indicator, is not a guarantee of access because not all physicians accept these insurance programs. Physicians indicated their rate of Medicare acceptance in national survey of over 20,000 doctors conducted by Merritt Hawkins for The Physicians Foundation (www.physiciansfoundation. org). North Dakota has the highest rate of Medicare acceptance by physicians at $95 \%$ and is ranked 1st in Merritt Hawkins' PAI, while Hawaii has the lowest rate at 80.9\% and is rated 50th.

## 20. MEDICAID BENEFICIARIES AS A PERCENT OF TOTAL POPULATION

Source: The Henry J. Kaiser Family Foundation, 2012.
The availability of health insurance coverage, including Medicaid, generally is considered a positive access indicator. Vermont has the highest per capita rate of Medicaid coverage at $32 \%$ and is ranked 1st by Merritt Hawkins PAI, while New Jersey has the lowest rate at $11.9 \%$ and is ranked 50 th.

## 21. PHYSICIAN MEDICAID ACCEPTANCE RATES

Source: The Physicians Foundation/Merritt Hawkins 2014 Survey of America's Physicians.
As referenced above, Medicare coverage does not guarantee access to physicians, and the same statement is even more applicable to Medicaid coverage, as fewer physicians accept Medicaid as a form of payment than accept Medicare. In The Physicians Foundation/Merritt Hawkins' survey referenced above, doctors indicated their rate of Medicaid acceptance, and there is considerable variation by state. Vermont has the highest rate of physician Medicaid acceptance at $100 \%$ and is ranked 1st in Merritt Hawkins' PAI while New Jersey has the lowest physician Medicaid acceptance rate at $67.3 \%$ and is ranked 50th.

## 22. STATES THAT EXPANDED MEDICAID ELIGIBILITY THROUGH THE AFFORDABLE CARE ACT (ACA)

Source: $24 / 7$ Wall Street/Department of Health and Human Services, July 2014.
While Medicaid coverage does not guarantee care, such coverage is considered preferable in Merritt Hawkins' PAI to no coverage. Twenty-nine states elected to expand Medicaid eligibility through the Affordable Care Act, providing coverage to several million people who previously lacked health insurance. Each of these states was allotted a 1st ranking, while the remaining states were allotted a 30th ranking.

## 23. FEDERALLY QUALIFIED COMMUNITY HEALTH CENTER PATIENT ENCOUNTERS PER CAPITA

Source: National Association of Community Health Centers.
Now in their 50th year, Federally Qualified Community Health Centers (FQHCs) provide care through approximately 1,300 Health Center organizations nationwide with sites in more than 9,200 rural and urban communities. The mission of FQHCs is to deliver quality, accessible care to traditionally underserved populations regardless of the patient's ability to pay. The presence of high FQHC utilization per capita by state is considered a positive physician, PA and NP access metric in Merritt Hawkins' PAI. Vermont is experiencing the most FQHC patient encounters per capita and is therefore ranked first, while Nevada is experiencing the fewest and is ranked 50th.

## 24. NURSE PRACTITIONERS PER 100,000 POPULATION

Source: American Medical Association Master File.
Advanced practice professionals such as nurse practitioners (NPs) are supplementing the physician workforce by performing some of the tasks and treatments that physicians perform. A high number of NPs per capita is considered by Merritt Hawkins' PAI to increase access to medical services. Massachusetts has both the highest number of physicians and the highest number of NPs per capita and is ranked 1st by Merritt Hawkins' PAI while Hawaii has the fewest and is ranked 50th.

## 25. STATES WHERE NURSE PRACTITIONERS HAVE PRACTICE AUTONOMY

Source: American Association of Nurse Practitioners.
Full practice autonomy for nurse practitioners is considered a positive access metric in Merritt Hawkins' PAI, though no quality of care implications either positive or negative are implied. Twenty-one states offer NPs full practice autonomy and each is ranked first in Merritt Hawkins' PAI. Those 17 states that offer somewhat limited practice autonomy to NPs are ranked 22 nd and the remaining 12 states that offer the most limited practice autonomy to NPs are ranked 39th.

## 26. PHYSICIAN ASSISTANTS PER $\mathbf{1 0 0}, \mathbf{0 0 0}$ POPULATION

Source: American Medical Association Master File.
Physician assistants (PAs) also are increasing overall clinician resources by performing some of the tasks and treatments physicians perform. A high number of PAs per capita therefore is considered by Merritt Hawkins' PAI likely to increase access to medical services. Alaska has the highest rate of PAs per capita and is ranked 1st by Merritt Hawkins' PAI, while Mississippi has the lowest and is ranked 50th.

## 27. PERCENTAGE OF POPULATION 65 OR OLDER

Source: United States Census Bureau.
Approximately $14 \%$ of the U.S. population is made up of people 65 or older who are eligible for Medicare. This population group accounts for a disproportionate amount of physician visits (twice the number of the national average for all population groups), 37.4\% of all in-patient procedures and $47.1 \%$ of all diagnostic treatments and tests, according to the Center for Disease Control. States with the youngest populations therefore are likely to have relatively less demand for physician services than states with relatively old populations and potentially better access. At $9 \%$, Alaska has the lowest percent of population 65 or older and is ranked 1st, while Florida has the oldest at $18.7 \%$ and is ranked 50th.

## 28. PERCENTAGE OF PHYSICIAN WORKFORCE 60 OR OLDER

Source: Association of American Medical Colleges 2013 State Physician Workforce Data Book.
Physicians, like the general population, are growing older on average, and a larger number of physician retirements can be expected in the next five to ten years than number of new physicians entering the workforce (for a more detailed discussion of this topic, see Merritt Hawkins' white paper The Aging Physician Workforce: A Demographic Dilemma.) A high percentage of physicians 60 or older therefore is likely to reduce patient access to medical services. At $22.6 \%$, North Carolina has the fewest physicians 60 or older and is ranked 1st in Merritt Hawkins' PAI, while at 33.3\%, New Mexico has the most and is ranked 50th.

## 29. PERCENTAGE OF PHYSICIANS PLANNING TO RETIRE IN THE NEXT ONE TO THREE YEARS.

Source: The Physicians Foundation/Merritt Hawkins 2014 Survey of America's Physicians.
In this survey of over 20,000 physicians, doctors indicated whether or not they are planning to retire in the next one to three years. A low percent of physicians planning to retire by state is considered by Merritt Hawkins' PAI as a positive access indicator. At 4.6\%, Utah has the fewest physicians planning to retire in the next one to three years and is ranked 1st by Merritt Hawkins' PAI, while at $21.3 \%$ Idaho has the most and is ranked 50th.

## 30. PERCENTAGE OF PHYSICIANS OVERWORKED OR OVEREXTENDED

Source: The Physicians Foundation/Merritt Hawkins 2014 Survey of America's Physicians.
In this survey of over 20,000 physicians, physicians indicated whether or not they are at capacity or are overextended in their practices and cannot take on new duties. States with the lowest number of physicians indicating they are at capacity or are overextended are given a low ranking by Merritt Hawkins' PAI while those with a relatively high number are given a high ranking. At $72.1 \%$, Idaho has the fewest physicians who indicate they are overextended and is ranked 1st in Merritt Hawkins' PAI, while at 97.1\%, Wyoming has the most and is ranked 50th.

## 31. STATES INCORPORATING TELEHEALTH

Source: American Telemedicine Association (TMA).
In March, 2015, the TMA released an analysis of state-by-state incorporation of telehealth services based on number of telehealth "originating sites" in the state, eligible technology, eligible providers, insurance coverage and related factors. States were given A, B, C, or F grades for telehealth incorporation by the TMA based on these metrics. In Merritt Hawkins' PAI, those states receiving an A grade were ranked first and those given lesser grades were assigned higher numerical rankings as appropriate.

## 32. URGENT CARE CENTERS PER CAPITA

## Source: Urgent Care Association of America (UCAOA).

The UCAOA projects there currently are 6,900 urgent care centers in the United States. These centers offer care for non-life threatening conditions such as sprains, broken bones, flu colds, infections, cuts and others and typically are staffed by primary care physicians, PAs and NPs. Typically, urgent care centers are open seven days a week with evening and weekend hours and are part of the "convenient care" movement in which consumers select sites of service based in part on ease of access. In Merritt Hawkins PAI, those states with the greatest number of urgent care centers per capita receive a low numerical ranking and those with a low number are given a high ranking. Maine has the highest number of urgent care centers per capita and is ranked 1st in Merritt Hawkins PAI while Massachusetts has the fewest and is ranked 50th.

## 33. RETAIL CLINICS PER CAPITA

## Source: Convenient Care Association.

A growing number of retail and pharmacy chains, including Walmart, CVS, Target and others, are opening walk-in clinics providing care for routine conditions such as sore throat, ear infections, and colds, as well as preventive services such as flu shots and screening for hypertension and cholesterol. Retail clinics generally are open seven days a week from approximately 8 a.m. to 8 p.m., with more limited hours on weekends, with appointments not required. The great majority of care in these settings is provided by PAs and NPs. Kentucky has the has the most retail clinics per capita and is ranked first by Merritt Hawkins' PAI, while each state with no retail clinics is ranked 41st. For more information on urgent care centers and retail clinics see the Merritt Hawkins' white paper Convenient Care: Growth and Staffing Trends in Urgent Care and Retail Medicine.

## CONCLUSION: ENHANCING PHYSICIAN ACCESS

While the scores and rankings in Merritt Hawkins' Physician Access Index provide indicators of the potential ease or difficulty patients may have in each state accessing the services of physicians, nurse practitioners and physician assistants, it should be noted that the access, quality, and cost of physician services varies from region to region within the nation and within given states. Within any given state, region, or community, economically advantaged urban dwellers and the Medicare eligible generally are likely to have greater access to medical services than economically disadvantaged urban dwellers, rural dwellers in general and the Medicaid eligible.

In addition, the availability or rate of insurance coverage does not always translate to positive physician access. Though Massachusetts has the most positive physician access metrics of any state, including a high percent of insured population, there have been reports of long physician appointment wait times in the state, including Merritt Hawkins' 2014 Survey of Physician Appointment Wait Times and Medicaid and Medicare Acceptance Rates. Multiple factors come into play, including insurance acceptance rates and practice patterns among physicians, that may cause patient access to physicians to vary.

Nevertheless, the specific variations within states regarding their physician resources, their ability to grow those resources, the practice patterns and demographics of their physicians and their patient populations, insurance coverage rates, income levels, autonomy levels of non-physician clinicians, and the other metrics tracked in Merritt Hawkins' PAI are worth enumerating. By identifying these metrics, Merritt Hawkins' PAI offers policy makers, healthcare administrators, physicians, academics and others who track physician access issues a reference point for determining which physician access factors states may be able to influence to enhance access to physicians and other clinicians.

These factors include:

```
- Physicians per 100,000 population, a ratio than can be improved where needed through the addition of new medical schools and residency positions.
```

- Medicaid expansion to provide coverage for the previously uninsured.
- Increased autonomy for nurse practitioners and physician assistants.
- Increased coverage of and provider reimbursement for telehealth services.
- The addition of Federally Qualified Community Health Centers and other social support services, which may include funding for physician retention and for rural physician training programs.

## - The development of additional urgent care centers and retail clinics.

Other measures to increase access to physician services are more difficult to address and will require broad, societal solutions, primary among these the growth of economic opportunities for less affluent members of society. Increased affluence promotes health and reduces utilization of physician and other medical services, while allowing access to those services when needed. The connection between poverty and healthcare utilization is explored in more detail in the paper by Richard Cooper, MD cited above and in Dr. Cooper's book, Poverty and the Myths of Health Care Reform: Why Poverty and Income Inequality Are at the Core of America's High Health Care Spending, to be available through Johns Hopkins Press in 2016.

Access to physician services is likely to vary by state, by community, by economic status and other factors tracked in Merritt Hawkins' PAI for the indefinite future, but can be enhanced most effectively in all locations and circumstances by accelerating economic progress.

## MERRITT HAWKINS' ADDITIONAL DISCUSSION GROUPS/SURVEYS/WHITE PAPERS

Merritt Hawkins' hosts a professional Discussion Group on Linkedln to review and discuss matters pertaining to physician recruiting, compensation, workforce solutions and related healthcare trends. To join, visit http://linked.in/AB6mOC.

Merritt Hawkins is an AMN Healthcare company. AMN Healthcare, the largest healthcare staffing organization in the United States, is the industry innovator of healthcare workforce solutions. Surveys and white papers completed by Merritt Hawkins or other AMN companies include:

- Survey of Physician Appointment Wait Times
- A Survey of America's Physicians: Practice Patterns and Perspectives (in partnership with The Physicians Foundation).
- Physician Inpatient/Outpatient Revenue Survey
- Survey of Final Year Medical Residents
- Survey of Physician Assistant Salaries, Signing Bonuses and Related Incentives (in collaboration with the American Academy of Physician Assistants)
- Clinical Staffing and Recruiting Survey/Survey of Physician Practice Patterns \& Satisfaction (in collaboration with the Indian Health Service)
- Survey of Alumni Satisfaction and Health System Trends (in collaboration with Trinity Unversity)
- Survey of Membership Compensation, Career Satisfaction, and Personal Perspectives (in partnership with the American Academy of Surgical Administrators)
- White Paper: Physician Aging, A Demographic Dilemma.
- White Paper: Women In Medicine
- White Paper: The Physician Shortage, Data Points and State Rankings
- White Paper: Nurse Practitioners and Physician Assistants, Supply, Demand and Scope of Practice
- White Paper: Incentive-Based Physician Compensation
- Hospital-Specific Physician Requirements Model (in conjunction with Richard "Buz" Cooper, M.D., University of Pennsylvania)
- White Paper: Ten Keys to Physician Retention
- White Paper: The Cost of A Physician Vacancy
- White Paper: RVU-Based Physician Compensation
- White Paper: The Economic Impact of Physicians
- Curriculum: Physician Recruiting, The University of Florida
- Review of Temporary Healthcare Staffing Trends \& Incentives
- Review of Temporary Healthcare Staffing Trends \& Incentives (Mid-level Providers)
- Survey of Chief Nursing Officers
- Survey Registered Nurses
- Survey of Travel Nurses

## BOOKS WRITTEN BY MERRITT HAWKINS:

- Will the Last Physician in America Please Turn Off the Lights? A Look at America's Looming Physician Shortage, Fourth Edition
- Merritt Hawkins Guide to Physician Recruiting
- In Their Own Words: 12,000 Physicians Reveal Their Thoughts on Medical Practice in America (in partnership with The Physicians Foundation).

## SPEAKING PRESENTATIONS FROM MERRITT HAWKINS AND AMN HEALTHCARE

## An Educational Resource

Merritt Hawkins and AMN Healthcare are committed to providing survey data and other information of use to healthcare executives, physicians, policy makers and members of the media.

AMN Healthcare offers speakers to address healthcare industry trends in staffing, recruiting and finance.

## Topics include:

- Medical Practice in America: Past, Present and Future

The Physician Workforce
Clinical Workforce Solutions
Evolving Physician Staffing Models
Physician and Nurse Shortage Issues and Trends
How to Make Your Hospital or Group a Physician Magnet
New Strategies for Healthcare Staffing
Healthcare Reform and Workforce Issues
Economic Forecasting for Clinical Staffing
Allied Staffing Shortages
Vendor Management
Recruitment Process Outsourcing
Other topics Upon Request

For more information or to schedule a speaking engagement, please contact:
